

Quality measurement for the project motivation

How stillness impacts productivity of a knowledge worker with proof?

To measure a progress of a person with long short term monitoring

With a game sequence: **attention** – stimulus – **decision** – action – analysis
measure *time of reaction* and *quality of decision*

Monitor from two months to a year to show the connection of neuroplasticity and mechanical training.

How it works for the manual labor with A/B test: measure **amount of delivered product**
before and after deployment, compare to a control group

Labor workers install a partition wall

One class versus the rest: manual labor monitoring

How this applicable for a knowledge worker?

Apply productivity a labour worker to a knowledge worker

Daily setup for for a knowledge worker: a person

- listens in an advanced headset (**EEG**)
- wears a watch (**IMU**)
- has a mobile (**monitor**)
- with 5G (**AI model**).

What regular type of equipment could fit the description?
